

# Oauth2 provider

Our Forgejo git forge supports connecting external services via the Oauth2 provider API. This is a password-less, scoped and token-based authentication method that can be safely used with 3rd party apps.

You can access your personal Oauth2 access tokens via the [Settings -> Applications menu](#) where it is also possible to revoke access tokens. As an organisation repository owner you can also generate access tokens there.

Our internal [Opengist service](#) is directly connected via Oauth2 to your main account. But 3rd party native apps such as [GitNex](#) can also use it. You can also log into our [Loomio group collaboration tool](#) via Oauth2. If you already made a Loomio account, please make sure it uses the same email address and then it is possible to link it to your main F-hub.org account via Oauth2.

For more details, [please see the Gitea documentation](#).
